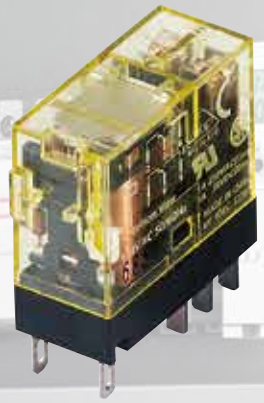
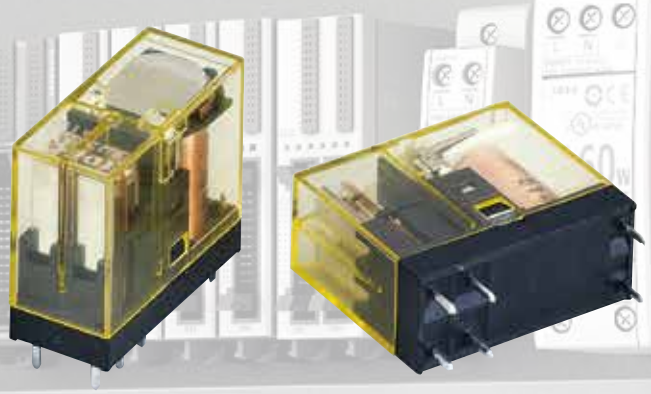
Think Automation and beyond...

RJ Series
Slim Power Relays (Bifurcated Contacts)

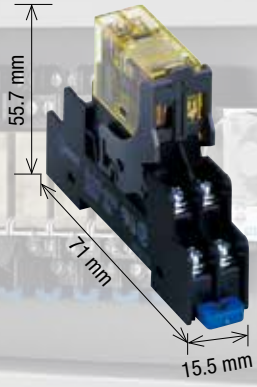
- RJ22S Plug-in Terminal

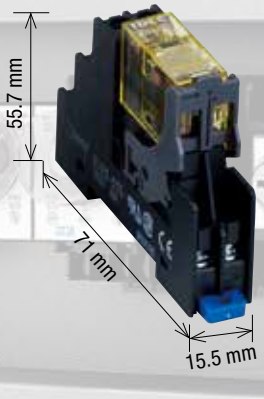


- RJ22V PC Board Terminal



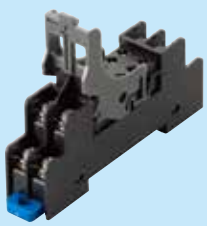
When mounted in a socket





High contact reliability with bifurcated contacts

2-pole SJ sockets



Standard Screw Terminals

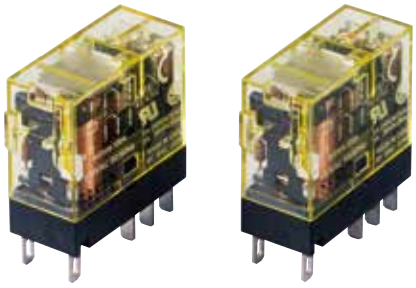
Finger-safe Screw Terminals (IP20)

PC Board Terminals

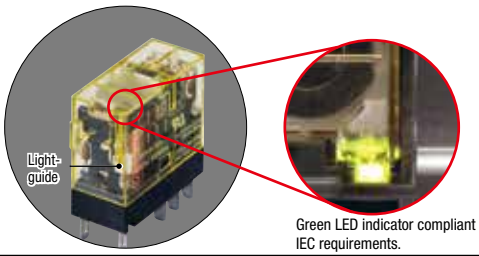
RJ Series Slim Power Relay Plug-in Terminal (bifurcated contacts)

High contact reliability with bifurcated contacts (minimum applicable load: 1V DC, 100µA)

- The smallest width for 2-pole/bifurcated contacts relay (based on IDEC research as of July 2017)
- Non-polarized green LED indicator available (except for simple type)
- IDEC's unique light-guide structure enables an RJ relay to be identified by the illuminating LED.
- Diode, reverse polarity diode, and RC circuits are available.
- Peak inverse voltage is 1000V.
- UL recognized, CSA certified, VDE approved, EN compliant.



- IDEC's unique light-guide structure



Green LED indicator compliant with IEC requirements.

Applicable Standards

Standards	Mark	File No. or Organization
UL508		UL Recognized File No. E55996
CSA C22.2 No.14		CSA File No. LR35144
EN61810-1	VDE REG.-Nr.8312	VDE No. 40015055
	CE	EU Low Voltage Directive

Relays

Bifurcated Contacts

Type	2-pole (bifurcated contacts DPDT)	
	Part No. (Ordering No.)	Coil Voltage Code
Standard (with LED indicator)	RJ22S-CL-∗	A12, A24, A110, A115, A120, A220, A230, A240, D5, D6, D12, D24, D48, D100
Simple (without LED indicator)	RJ22S-C-∗	
With diode (with LED indicator)	RJ22S-CLD-∗	D5, D6, D12, D24, D48, D100

Note: Maximum continuous applied voltage is the maximum voltage that can be applied to relay coils.

Specifications

Relay		RJ22S
Number of Poles		2-pole
Contact Configuration		DPDT (bifurcated contacts)
Contact Material		AgNi (gold clad)
Degree of Protection		IP40
Contact Resistance (initial value)		50 mΩ maximum (measured using 5V DC, 1A voltage drop method)
Operating Time (at 20°C)		15 ms maximum (at the rated coil voltage, excluding contact bounce time) With diode or RC: 20 ms maximum
Release Time (at 20°C)		10 ms maximum (at the rated coil voltage, excluding contact bounce time) With diode or RC: 20 ms maximum
Impulse Withstand Voltage		10,000V AC (between contact and coil)
Insulation Resistance		100 MΩ minimum (500V DC megger)
Dielectric Strength	Between contact and coil	5,000V AC, 1 minute
	Between contacts of the same pole	1,000V AC, 1 minute
	Between contacts of the different poles	3,000V AC, 1 minute
Vibration Resistance	Operating Extremes	10 to 55 Hz, amplitude 0.75 mm
	Damage Limits	10 to 55 Hz, amplitude 0.75 mm
Shock Resistance	Operating Extremes	NO contact: 200 m/s^2, NC contact: 100 m/s^2
	Damage Limits	1,000 m/s^2
Electrical Life		AC load: 100,000 operations minimum (operating frequency 1,800 per hour) DC load: 200,000 operations minimum (operating frequency 1,800 per hour)
Mechanical Life		AC load: 10 million operations minimum (operating frequency 18,000 operations per hour) DC load: 20 million operations minimum (operating frequency 18,000 operations per hour)
Operating Temperature (100% rated voltage)		–40 to +70°C (no freezing)
Operating Humidity		5 to 85%RH (no condensation)
Storage Temperature		–40 to +85°C (no freezing)
Storage Humidity		5 to 85%RH (no condensation)
Weight (approx.)		19g

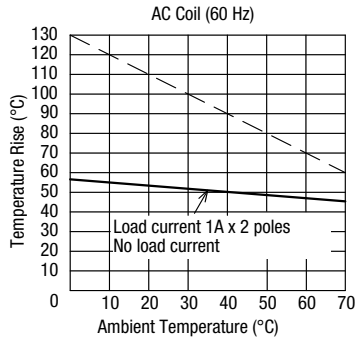
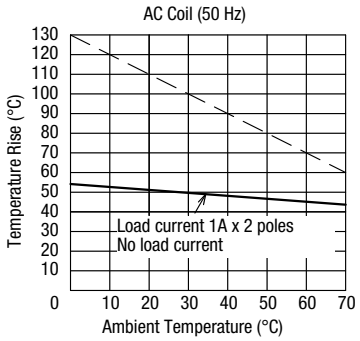
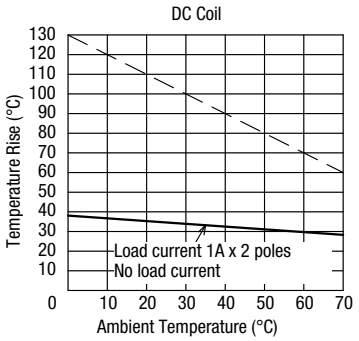
Operating Temperature and Coil Temperature Rise







- The slanted dashed line indicates the allowable temperature rise for the coil at different ambient temperatures.
- The above temperature rise curves show the characteristics when 100% of the rated coil voltage is applied.

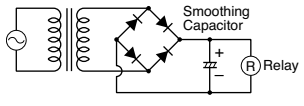
⚠ Safety Precautions

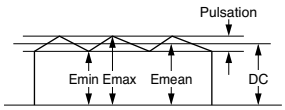
- Turn off the power to the RJ relay before starting installation, removal, wiring, maintenance, and inspection. Failure to turn power off may cause electrical shock or fire hazard.
- Observe the specifications and rated values, otherwise electrical shock or fire hazard may be caused.
- Use wires of the proper size to meet the voltage and current requirements.
- Tighten terminal screws to a proper tightening torque.

Instructions

1. Driving Circuit for Relays

1. To make sure of correct relay operation, apply rated voltage to the relay coil.
2. Input voltage for DC coil:
   Complete DC voltage is best for the coil power to make sure of stable operation. When using a power supply containing a ripple voltage, suppress the ripple factor within 5%. When power is supplied through a rectification circuit, relay operating characteristics, such as pickup voltage and dropout voltage, depend on the ripple factor. Connect a smoothing capacitor for better operating characteristics as shown below.

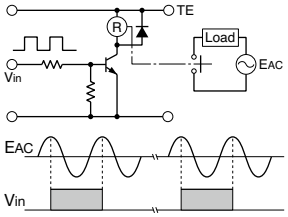




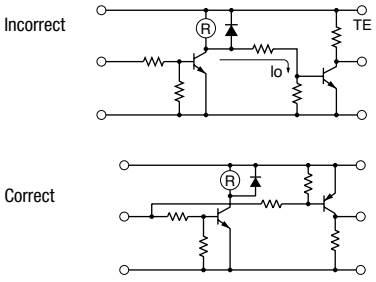
$$\text{Ripple Factor (\%)} \quad \frac{\text{Emax} - \text{Emin}}{\text{Emean}} \times 100\%$$

Emax = Maximum of pulsating current
Emin = Minimum of pulsating current
Emean = DC mean value

3. Operating the relay in sync with an AC load:
   If the relay operates in sync with AC power voltage of the load, the relay life may be reduced. If this is the case, select a relay in consideration of the required reliability for the load. Or, make the relay turn on and off irrespective of the AC power phase or near the point where the AC phase crosses zero voltage.

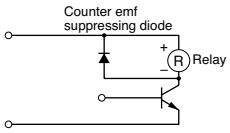


4. Leakage current while relay is off:



When driving an element at the same time as the relay operation, special consideration is needed for the circuit design. As shown in the incorrect circuit below, leakage current (Io) flows through the relay coil while the relay is off. Leakage current causes coil release failure or adversely affects the vibration resistance and shock resistance. Design a circuit as shown in the correct example.

5. Surge suppression for transistor driving circuits:
   When the relay coil is turned off, a high-voltage pulse is generated. Be sure to connect a diode to suppress the counter electromotive force. Then, the coil release time becomes slightly longer. To shorten the coil release time, connect a Zener diode between the collector and emitter of the controlling transistor. Select a Zener diode with a Zener voltage slightly higher than the power voltage.

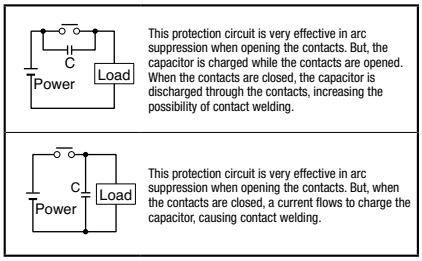


2. Protection for Relay Contacts

1. The contact ratings show maximum values. Make sure that these values are not exceeded. When an inrush current flows through the load, the contact may become welded. If this is the case, connect a contact protection circuit, such as a current limiting resistor.
2. Contact protection circuit:
   When switching an inductive load, arcing causes carbides to form on the contacts, resulting in increased contact resistance. In consideration of contact reliability, contact life, and noise suppression, use of a surge absorbing circuit is recommended. Note that the release time of the load becomes slightly longer. Check the operation using an actual load. Incorrect use of a contact protection circuit will adversely affect switching characteristics. Four typical examples of contact protection circuits are shown in the following table:

RC		This protection circuit can be used when the load impedance is smaller than the RC impedance in an AC load power circuit. R: Resistor of approximately the same resistance value as the load C: 0.1 to 1 μF
		This protection circuit can be used for both AC and DC load power circuits. R: Resistor of approximately the same resistance value as the load C: 0.1 to 1 μF
Diode		This protection circuit can be used for DC load power circuits. Use a diode with the following ratings. Reverse withstand voltage: Power voltage of the load circuit × 10 Forward current: More than the load current
Varistor		This protection circuit can be used for both AC and DC load power circuits. For a best result, when using on a power voltage of 24 to 48V AC/DC, connect a varistor across the load. When using on a power voltage of 100 to 240V AC/DC, connect a varistor across the contacts.

3. Do not use a contact protection circuit as shown below:



Generally, switching a DC inductive load is more difficult than switching a DC resistive load. Using an appropriate arc suppressor will improve the switching characteristics of a DC inductive load.

3. Notes on PC Board Mounting

- When mounting 2 or more relays on a PC board, keep a minimum spacing of 5 mm in each direction.
- Manual soldering: Solder the terminals at 350°C within 3 sec., using a soldering iron of 60W (Sn-Ag-Cu type) is recommended.
- Auto-soldering: Solder at 250°C within 4 to 5 sec.
- Because the terminal part is filled with epoxy resin, do not excessively solder or bend the terminal. Otherwise, air tightness will degrade.
- Avoid the soldering iron from touching the relay cover or the epoxy filled terminal part.
- Use a non-corrosive resin flux.

4. Others

1. General notice:
   - To maintain the initial characteristics, do not drop or shock the relay.
   - The relay cover cannot be removed from the base during normal operation. To maintain the initial characteristics, do not remove the relay cover.
   - Use the relay in environments free from dust, sulfur dioxide (SO_2), hydrogen sulfide (H_2S), or organic gases.
   - Make sure that the coil voltage does not exceed the applicable coil voltage range.
2. Connecting outputs to electronic circuits:
   When the output is connected to a load which responds very quickly, such as an electronic circuit, contact bouncing causes incorrect operation of the load. Take the following measures into consideration.
   a. Connect an integration circuit.
   b. Suppress the pulse voltage due to bouncing within the noise margin of the load.
3. Do not use relays in the vicinity of strong magnetic fields, as this may affect relay operation.
